Sedation - Wikipedia
Sedation scales are used in medical situations in conjunction with a medical history in assessing the applicable degree of sedation in patients in order to avoid under-sedation (the patient risks experiencing pain or distress) and over-sedation (the patient risks side effects such as suppression of breathing, which might lead to death).

Sedation - EMCRIT Project
Nov 03, 2020 - Basal sedation. This refers to a mild degree of sedation which may be used continuously. Basal sedation alone should be mild enough that it doesn’t compromise the ability to protect the patient’s airway. The functional definition of basal sedation is that the patient could be safely extubated on this level of sedation.
